

Write a README in your team's GitHub repository with these sections:

App Summary: 5-8 sentences on the problem your product solves, who experiences it, and what the app does.

This product solves the problem of group project coordination. Usually people with busy schedules have a hard time managing meeting times and getting deadlines under control. This web application helps coordinate, manage deadlines, notify group members when they need a reminder to do their tasks all with the help of AI. This app has a dashboard showing current project progress and which individual tasks still need to get done. Availability is easy input-able with the help of AI

ERD: Your diagram from Step 1, embedded as an image in the README. The README is where we look for your ERD.

Tech Stack: What you used at each layer, and why this approach fits your team.

Layer	Technology	Purpose
-------	------------	---------

Frontend	React + TypeScript	Dashboard, forms, tasks, and chat
Styling	CSS	Layout, colors, and responsive design
Framework	Vinext / Vite	Next.js-style pages and backend API routes
Backend	Cloudflare Workers	Handles requests, permissions, and saving data
Database	Cloudflare D1 (SQLite)	Stores projects, memberships, profiles, files metadata, and chats
Database tooling	Drizzle ORM	Defines the schema and migrations; backend queries use D1 SQL
File storage	Cloudflare R2	Stores uploaded files
Authentication	Sign in with ChatGPT	Identifies users
AI	Google Gemini API	Assignment chat and project planning
Hosting	Sites	Deploys and hosts the website
Version control	Git	Tracks source-code changes; can be pushed to GitHub

This approach fits our team because it was coded through a Codex agent which set up the backend from our PRD and the information we provided. It seemed like one of the more viable options available to us as we were already using AI to get everything built. It also keeps everything in one place making it easier to make adjustments if necessary.

How to Get It Running: Step-by-step instructions for getting a working copy -- from a fresh copy of the code, or, on a hosted platform, how to open the project and the live app.

The website is already deployed. You do not need to install dependencies or run a local server to use it.

1. Open the live application:
(<https://teamup-project-workspace.pthb8gkck4.chatgpt.site/>).

2. Click ****Sign in to get started**** and sign in with your ChatGPT account.
3. Click ****Create your first project****. Enter a project name, deadline, and optional course and description, then submit the form.
4. Open your project to add tasks, milestones, availability, and files.
5. To invite teammates, open ****Team****, click ****Create invite link****, and copy and share the link. Teammates sign in and select ****Accept invitation**** to join.
6. To return to a project later, open the same website and sign in. Your saved projects appear under ****Your Projects****.

Users can access only projects they created or joined.

Verifying the Vertical Slice: How to trigger your working button and confirm the change survives a page refresh.

Create a new project with the new project button. Name it whatever you'd like, add an optional description. Create it. Once in the project, click the add task button and assign a due date, assign it to someone, save changes. Click refresh and go back to your tasks in that project to see if the new task you created is still there.
